# Trimble Agriculture API

Open API for the Trimble Agriculture Cloud creates business opportunities for farmers and their partners

Farmers have the opportunity to use more technology than ever to run their operations, collect data, and derive value from that data. Integrating these technologies to connect the farmer's workflows is critical to maximising their effectiveness. The Trimble Agriculture APIs provide application and service providers the opportunity to enable data flow between their technology and the Trimble technology farmers are already using to plan, execute, and record field work.

Common API workflows:

- Align client/farm/field, boundaries, guidance lines, and landmarks
- Send prescriptions or work orders directly to displays
- Forward as-applied data and summaries
- Access live machine data

Connecting to the Trimble Agriculture API is simple
